Safety Guidelines

Warning notices must be observed to ensure personal safety as well as that of others, and to protect the product and the connected equipment. These warning notices are accompanied by a clarification of the level of caution to be observed.

Qualified Personnel

This device/system may only be set up and operated in conjunction with this manual. Qualified personnel are only authorized to install and operate this equipment in accordance with established safety practices and standards.

Warning: This product can only function properly and safely if it is correctly transported, stored, installed, set up, operated, and maintained.

Note: Always use product in accordance with specifications.

Milltronics MSI Belt Scale

Milltronics MSI belt scale is a heavy-duty, high-accuracy single idler scale for process and load-out control.

The MSI belt scale includes:

- one weighbridge with two load cells with leads run in liquid-tite conduit and 150 cm (5 ft.) of interconnecting cable terminated with lugs and conduit fitting
- Siemens Milltronics test weight(s)

The addition of an idler (supplied and installed by the customer) to the weighbridge completes the weighing assembly. The MSI load cells provide an electronic signal, proportional to load, which is fed to the Siemens Milltronics integrator. Thus, weighing is accomplished without interrupting the process and without affecting the process material.

Note: The Milltronics MMI belt scale comprises two or more MSI belt scales installed in succession.

The MSI is an accurate and repeatable force sensor. Its performance is ultimately dependent upon the conveyor system and the quality of the installation and alignment.

Safety Notes

Special attention must be paid to warnings and notes highlighted from the rest of the text by grey boxes.

WARNING means that failure to observe the necessary precautions can result in death, serious injury, and/or considerable material damage.

Note: means important information about the product or that part of the operating manual.

The Manual

This instruction manual covers the installation, operation and maintenance of the MSI belt scale.

Please refer to this manual for proper installation and operation of any component of the weighing system to which the MSI is being applied. Adhering to the installation and operating procedures will ensure a quick, trouble-free installation and allow for the maximum accuracy and reliability of your weighing system. Because the MSI belt scale is used in conjunction with an integrator, refer to the integrator’s manual as well.

If you have any questions, comments, or suggestions about the manual contents, please email us at techpubs@siemens-milltronics.com.

For the complete library of Siemens Milltronics manuals, go to www.siemens-milltronics.com.
Specifications

Accuracy
• ± 0.5% of totalization over 5 to 1 operating range

Load Cell
• construction: stainless steel with superior moisture protection
• excitation: 10 V DC nominal, 15 V DC maximum
• output: 2 mV / V excitation at rated load cell capacity
• non-linearity: 0.02% of rated output
• hysteresis: 0.02% of rated output
• non-repeatability: 0.01% of rated output
• capacity: maximum ranges: 50, 100, 250, 500, 750, 1000 lb
• overload: safe 150% of rated capacity
• ultimate 300% of rated capacity
• temperature: – 40 to 85 °C (– 40 to 185 °F) operating range
  – 18 to 65 °C (0 to 150 °F) compensated

Belt Width
• 18” to 96” in 1” increments to suit CEMA sizes, equivalent to 500 to 2000 mm in metric sizes
• refer to Outline Dimensions on page 17

Belt Speed
• up to 4 m/s (800 fpm)

Capacity
• up to 5000 t/h (5500 STPH) at maximum belt speed

Conveyor Incline
• ± 20° from horizontal, fixed incline
• up to ±3 0° with reduced accuracy

Conveyor Idler
• flat to 35°
• up to 45° with reduced accuracy
Idler Diameter
- 50 to 180 mm (2 to 7")

Idler Spacing
- 0.5 to 1.5 m (1.5 to 5.0 ft)

Weight
- see chart, Outline Dimensions on page 17

Note: The combination of capacity, speed, and idler spacing must result in a usable conveyor belt loading value.

Hazardous Locations
- with the use of approved intrinsically safe barrier strips

Approvals
- CSA certified for general purpose
Operation

The MSI weighbridge is designed to react only to the vertical component of the force being applied to it. The MSI consists of a fixed support frame (static) and a live frame (dynamic).

The static frame is the main scale support between the conveyor stringers which in turn supports the dynamic frame including the load cells.

The dynamic frame supports the scale idler and transfers the weight of the material to the load cells.

As the material travels along the conveyor belt, a force is exerted through the suspended idler to the dynamic frame. The dynamic frame is forced down proportionally. The movement in the load cell is sensed by its strain gauges when excited by voltage from the electronic integrator and produces a signal proportional to weight, which is returned to the integrator. The movement in each load cell is limited by the positive stop incorporated in the design of the load cell.
Installation

The MSI is shipped from the factory as a single unit attached to a shipping frame for protection. The unit must be removed from its shipping frame and inspected for physical damage.

Be sure the conveyor design meets the installation requirements for the Siemens Milltronics MSI scale. The conveyor stringers must be rigid, straight, parallel to and square with the belt line in the area of the scale installation. The idler to be used on the scale and at least the next two approach and retreat idlers must be of the same style and manufacture and in good condition.

Prepare the site in accordance with the Siemens Milltronics drawing(s) provided or by referring to the Belt Scale Applications Guidelines (7ML19985GA01).

Welding

WARNING: Use extreme care when arc welding in the area of the belt scale. Ensure that no welding current can flow through the belt scale. Welding currents passing through the scale can functionally damage the load cells.

Load Cell Handling

The load cell can tolerate very little negative displacement without damaging the load cell.

When handling the MSI, install both shipping stops to their vertical position to protect the load cells. Do not lift the MSI by the dynamic frame or subject it to shock from blows of a hammer when trying to position it.

Installation Precautions

The following precautions should be observed when handling the scale.

- Do not pry on the idler, its mountings, or the cells directly.
- Do not stand or lean on the scale.
- Avoid shock from blows of a hammer when trying to position the scale during installation.
- Do not lift the MSI by its idler.
Installation Procedure

1. Remove the conveyor idler currently at the point of installation.

2. Remove the idler foot plate and modify the idler frame at both ends of the idler as shown below.

   Occasionally (in less than 5% of applications) the combined effect of the idler rework and the clamping of the scale at its inboard mounting position could result in abnormal idler vibration. When this occurs, gusset plate reinforcements should be welded to the idler at the joints of the horizontal spine and the outer vertical leg member. See Idler Mounting on page 13 for further details.)

Typical Troughed Idler
For other types, refer to Idler Mounting, page 13.
3. Insert the MSI in the place of the removed idler. The MSI is designed to use the existing holes in the stringer and should not require further drilling. Install the mounting bolts and nuts but do not tighten. Remove the idler clips from the scale (see diagram below). Refer to Outline Dimensions on page 17, for working dimensions.

4. Position the scale so that it is centered and square to the stringer. Mount the modified idler so that it is centered on the scale using the idler clips. Tighten all mounting hardware.

   Position the scale so that the large arrow on the scale mounting brackets is pointing in the direction of belt travel.

   **Note:** Be sure there is sufficient clearance between the return belt, MSI, and its test weight (when used during the calibration procedure).
5. Release the shipping stops in order to free the weighing mechanism. Loosen screws ‘A’ and rotate both shipping stops inward until the underside slots slide around the screws ‘B’. Tighten screws ‘A’ to secure in place.

6. The idlers in the weighing area must be properly aligned and leveled by shimming the scale idler, the two approach and the two retreat idlers until they are within ± 0.8 mm (1/32”) of each other. Be sure to check that the idlers are centered and squared to the conveyor during the shimming process.
7. Precise idler alignment is very important to achieve maximum accuracy of the weighing system. Misaligned idlers will result in unwanted forces being applied on each idler in the weighing area, causing calibration and measurement errors. Use a good quality wire or string to check for alignment. The wire or string must be able to withstand sufficient tension in order to eliminate any sag. Adjust shims so that all rolls of the A2 through to the R2 idlers are in line within ±0.8 mm (1/32”).

Although the accepted tolerance for idler alignment is ±0.8 mm (1/32”), the scale mounted idler should never be lower than the adjacent idlers. Establishing good idler alignment is the most important part of the installation procedure. Scale accuracy is directly affected by alignment.
Calibration

After the MSI has been properly installed, calibration of the weighing system must be done in conjunction with the integrator. Refer to the integrator instruction manual for programming and calibration. The calibration is initially done using the supplied test load. Material tests are recommended to achieve maximum accuracy.

Test Load

The test load value for your MSI is given on the accompanying data sheet. The value is to be entered into the dedicated programming parameter of the integrator, in kilograms per meter or pounds per foot.

If the actual idler spacing differs from that recorded on the design data sheet, the test load must be recalculated as follows. Failure to do so will cause the design test load value to be in error.

\[
\text{test load} = \frac{\text{Total weight of all test weights}}{\text{idler spacing}} \quad \text{(Kg/m) or (lb/ft)}
\]

Zero

Perform the zero calibration as described in the Calibration section of the integrator manual.

Span

The test load used in the calibration procedure is a set of factory sized and supplied test weights (1 to 12).

The test weights are all to be placed on the test weight bar as shown.

Perform the span calibration as described in the Calibration section of the integrator instruction manual.

After the span calibration has been completed, remove the test load and store it.
Material Test

The MSI is guaranteed to be accurate to ± 0.5% when installed on a conveyor in accordance with this manual and meeting the qualifications outlined in Belt Scale Applications Guidelines (7ML19985GA01). This guarantee is based on calibrations performed using the test weights furnished with the scale and as referenced on the previous page.

When the existing conditions are such that the installation of the scale cannot meet the above mentioned requirements for an approved installation it is recommended that material tests be performed. This will enable the user to compare the present scale results to the results of the material tests. The scale is then adjusted or factored so that subsequent scale calibrations with test weights will agree with actual run of material.

Re-Rating

To be sure that proper design parameters are maintained, consult your Siemens Milltronics representative for any significant change in rate, speed and /or idler spacing from original design specifications.
Maintenance

Keep the weighbridge clean. Accumulation of material between the fixed support frame (static) and the live frame (dynamic) as well as around each load cell could affect the scale accuracy.

Periodically check the alignment of the stringers and idlers in the weighing area.

When a problem arises in the conveyor, it is possible that the scale will be affected. Therefore, periodic conveyor maintenance is important to proper scale operation which should include:

• lubrication of all pulleys and idlers
• proper belt tracking and training
• proper belt cleaning and scraping
• proper take up operation
• proper material feeding and spillage
• control

You can observe the integrity of the load cells by performing zero and span calibrations. If the zero and span deviations display a continuous unidirectional drift or the system becomes uncalibratable for no apparent mechanical reason, the load cells may be suspect.

Spare Parts

The only spare part recommended for the MSI is the load cell. Refer to the load cell nameplate for the proper size and model number.

Re-balance any load cell that has been replaced. Refer to the Load Cell Balancing Procedure For Four Load Cells in the integrator manual.

Maintenance Precautions

• When welding near the scale, do not allow current to pass through the belt scale.
• Reset the shipping stops to reduce physical shock to the load cells during maintenance.
• Recalibrate the scale after maintenance and prior to use.
Idler Mounting

The MSI is usually installed in conveyors employing conventional rigid structure idlers. Within this type of idler, construction will vary depending on the manufacture and the application. The idler depicted in the Installation Procedure section on page 6 uses an angle iron spine. The following images depict alternate idler construction and tips on how they should be modified and installed.
